Microsoft System Center Configuration Manager's SQL Server database contains valuable information about your users, computers, hardware, operating systems, applications, compliance status, and more. Microsoft has provided excellent tools for extracting this information in meaningful ways, including SQL Server Reporting Services (SSRS) and SQL Server Data Tools Business Intelligence (SSRS). System Center Configuration Manager Reporting Unleashed shows you how to make the most of these tools. World-renowned System Center reporting guru Garth Jones and his expert coauthor walk you through all facets of custom reporting with System Center. You'll walk through installing and configuring SSRS, using SQL views to find the data you need, writing SQL queries, creating basic and advanced reports, and using role-based administration to securely deliver those reports to the correct individuals. Jones brings together reliable, comprehensive, and up-to-date System Center reporting techniques you'll find in no other book or website. Using this guide, you can consistently retrieve the right information to solve immediate problems and quickly respond to management concerns. Detailed information on how to... • Install and configure SQL SSRS for optimal System Center reporting and easier troubleshooting • Understand the data stored in the ConfigMgr site database • Efficiently retrieve Configuration Manager data by writing SQL queries in SQL Server Management Studio • Learn best practices for developing and designing System Center reports • Create report templates, customize content with report parameters, and embed charts • Customize logos, color palettes, and other report elements for your own organization • Construct advanced drillthroughs to provide deeper understanding • Strengthen report security by integrating ConfigMgr role-based administration into SQL queries • Leverage reporting to measure KPIs and gain a better understanding of your environment • Tailor your reports to the needs of your organization • Foreword by Wally Mead, Principal Program Manager, Cireson The only book entirely dedicated to Configuration Manager reporting, this guide complements Meyler's System Center Configuration Manager Unleashed, offering far more in-depth coverage of reporting than the single chapter in that book. Most of the content in this new guide will be equally valuable in both System Center Configuration Manager 2016 and 2012 environments.

This book describes an approach to intelligent task planning in a robotic system. Petri net and fuzzy logic are integrated and used to represent task sequence planning and error recovery. During task plan generation and execution of task plans, different kinds of uncertainties need to be handled to ensure the efficiency and reliability of the system. Following a systematic modeling procedure, a fuzzy Petri net is constructed based on geometric relations, fuzzy variables, and reasoning structures. The resulting net can be used to analyze and control the system. Many examples are discussed to illustrate the theory and the applications of fuzzy Petri nets. Contents: Introduction Literature Review And/Or Net Representation for Robotic Task Sequence Planning Task Decomposition and Analysis of Robotic Assembly Plans Using Petri Nets Representation and Analysis of Uncertainty Using Fuzzy Petri Nets Task Sequence Planning Using Fuzzy Petri Nets Sensor-Based Error Recovery for Task Sequence Plans Using Fuzzy Petri Nets Conclusions Bibliography Index Readership: Computer scientists and engineers. keywords:

Since the late 1960s, there has been a revolution in robots and industrial automation, from the design of robots with no computing or sensory capabilities (first-generation), to the design of robots with limited computational power and feedback capabilities (second-generation), and the design of intelligent robots (third-generation), which possess diverse sensing and decision making capabilities. The development of the theory of intelligent machines has been developed in parallel to the advances in robot design. This theory is the natural outcome of research and development in classical control (1950s), adaptive and learning control (1960s), self-organizing control (1970s) and intelligent control systems (1980s). The theory of intelligent machines involves utilization and integration of concepts and ideas from the diverse disciplines of science, engineering and mathematics, and fields like artificial intelligence, system theory and operations research. The main focus and motivation is to bridge the gap between diverse disciplines involved and bring under a common cover several generic methodologies pertaining to what has been defined as machine intelligence. Intelligent robotic systems are a specific application of intelligent machines. They are complex computer controlled robotic systems equipped with a diverse set of visual and non visual sensors and possess decision making and problem solving capabilities within their domain of operation. Their modeling and control is accomplished via analytical and heuristic methodologies and techniques pertaining to generalized system theory and artificial intelligence. Intelligent Robotic Systems: Theory, Design and Applications, presents and justifies the fundamental concepts and ideas associated with the modeling and analysis of intelligent robotic systems. Appropriate for researchers and engineers in the general area of robotics and automation, Intelligent Robotic Systems is both a solid reference as well as a text for a graduate level course in intelligent robotics/machines. Part of a series of specialized guides on System Center - this book shares real-world expertise for using Configuration Manager capabilities to deliver more effective IT services. Series editor Mitch Tulloch and a team of System Center experts provide concise technical guidance as they step you through key deployment and management scenarios.

The fourth international workshop, " Engineering Societies in the Agents World " (ESAW 2003) was a three-day event that took place at the end of October 2003. After previous events in Germany, the Czech Republic, and Spain, the workshop crossed the Channel, to be held at the premises of Imperial College, London. The steady increase in the variety of backgrounds of contributing scientists, fascinating new perspectives on the topics, and number of participants, bespeaks the success of the ESAW workshop series. Its idea was born in 1999 among members of the working group on " Communication, Coordination, and Collaboration " of the first lease of life of the European Network of Excellence on Agent-Based Computing, AgentLink, out of a critical discussion about the general mindset of the agent community. At that time, we felt that proper consideration of systemic aspects of agent technology deployment, such as acknowledgement of the importance of the social and environmental perspectives, were sorely missing: a deficiency that we resolved should be addressed directly by a new forum.

This Proceedings contains the papers presented at the IFAC Workshop on Real-Time Programming held in Spain. During these last twelve years, the Workshop on Real-Time Programming (WRTP) has developed as an excellent forum for presenting the most relevant advances in the field of real-time computing and exchanging information and experiences among the real-time community. Several of the most relevant people of this community have participated in the reviewing process that plays, every time, a more important role. This year, 48 papers from 16 different countries have been submitted to the Workshop. After the review process, 31 of them have been selected for presentation including 2 industrial papers. They cover topics of formal methods, scheduling, distributed systems, embedded systems, design techniques, applications,

etc. Their discussion proved to be interesting and productive, and we are sure that it helped to throw light on some of the aspects of Real-Time Programming. WRTP 2000 was organised in co-operation with another event related to the real-time field: the Workshop on Algorithms and Architecture for Real-Time Control (AARTC). Both Workshops were scheduled with a common day of joint activities. This experience increased the level of cooperation and information exchanging between this two research communities which have several aspects in common.
