Plant Propagation A to Z

Native Trees, Shrubs, & Vines

Plant propagation is the reproduction of plants from cuttings or other parts of the parent plant. There are two methods of propagation: sexual and asexual. Sexual reproduction involves the fusion of male and female gametes to form a zygote, which develops into a new plant. Asexual reproduction involves the production of new plants from a single parent plant without the fusion of gametes. This can be achieved through various methods, including tip cuttings, layering, and grafting.
