Task Scheduling for Parallel Systems

Implementing Software Defined Radio

A new model for task scheduling that dramatically improves theefficiency of parallel systems Task scheduling for parallel systems can become a quagmire ofheuristics, models, and methods that have been developed over thepast decades. The author of this innovative text cuts through theconfusion and complexity by presenting a consistent andcomprehensive theoretical framework along with realistic parallelsystem models. These new models, based on an investigation of theconcepts and principles underlying task scheduling, take intoaccount heterogeneity, contention for communication resources, andthe involvement of the processor in communications. For readers who may be new to task scheduling, the firstchapters are essential. They serve as an excellent introduction toprogramming parallel systems, and they place task scheduling withinthe context of the program parallelization process. The author thenreviews the basics of graph theory, discussing the major graphmodels used to represent parallel programs. Next, the authorintroduces his task scheduling framework. He carefully explains thetheoretical background of this framework and provides severalexamples to enable readers to fully understand how it greatlysimplifies and, at the same time, enhances the ability toschedule. The second half of the text examines both basic and advancedscheduling techniques, offering readers a thorough understanding ofthe principles underlying scheduling algorithms. The final twochapters address communication contention in scheduling andprocessor involvement in communications. Each chapter features exercises that help readers put their newskills into practice. An extensive bibliography leads to additionalinformation for further research. Finally, the use of figures andexamples helps readers better visualize and understand complexconcepts and processes."Researchers and students in distributed and parallel computersystems will find that this text dramatically improves theirability to schedule tasks accurately and efficiently.

Based on the popular Artech House classic, Digital Communication Systems Engineering with Software-Defined Radio, this book provides a practical approach to quickly learning the software-defined radio (SDR) concepts needed for work in the field. This up-to-date volume guides readers on how to quickly prototype wireless designs using SDR for real-world testing and experimentation. This book explores advanced wireless communication techniques such as OFDM, LTE, WLA, and hardware targeting. Readers will gain an understanding of the core concepts behind wireless hardware, such as the radio frequency front-end, analog-to-digital and digital-to-analog converters, as well as various processing technologies. Moreover, this volume includes chapters on timing estimation, matched filtering, frame synchronization message decoding, and source coding. Both MATLAB and Simulink source code are included to assist readers with their projects in the field.

The availability of the RTL-SDR device for less than $20 brings software defined radio (SDR) to the home and work desktops of EE students, professional engineers and the maker community. The RTL-SDR can be used to acquire and sample RF (radio frequency) signals transmitted in the frequency range 25MHz to 1.75GHz, and the MATLAB and Simulink environment can be used to develop receivers using first principles DSP (digital signal processing) algorithms. Signals that the RTL-SDR hardware can receive include: FM radio, UHF band signals, ISM signals, GSM, 3G and LTE mobile radio, GPS and satellite signals, and any that the reader can (legally) transmit of course! In this book we introduce readers to SDR methods by viewing and analysing downconverted RF signals in the time and frequency domains, and then provide extensive DSP enabled SDR design exercises which the reader can learn from. The hands-on SDR design examples begin with simple AM and FM receivers, and move on to the more challenging aspects of PHY layer DSP, where receive filter chains, real-time channelisers, and advanced concepts such as carrier synchronisers, digital PLL designs and

QPSK timing and phase synchronisers are implemented. In the book we will also show how the RTL-SDR can be used with SDR transmitters to develop complete communication systems, capable of transmitting payloads such as simple text strings, images and audio across the lab desktop.

Extensive treatment is given to several standards, including IEEE 802.22 for TV White Spaces and IEEE SCC41 Written by leading people in the field, both at universities and major industrial research laboratories, this tutorial text gives communications engineers, R&D engineers, researchers, undergraduate and post graduate students a complete reference on the application of wireless communications and network theory for the design and implementation of cognitive radio systems and networks Each chapter is written by internationally renowned experts, giving complete and balanced treatment of the fundamentals of both cognitive radio communications and cognitive networks, together with implementation details Extensive treatment of the latest standards and spectrum policy developments enables the development of compliant cognitive systems Strong practical orientation – through case studies and descriptions of cognitive radio platforms and testbeds – shows how real world cognitive radio systems and network architectures have been built Alexander M. Wyglinski is an Assistant Professor of Electrical and Computer Engineering at Worcester Polytechnic Institute (WPI), Director of the WPI Limerick Project Center, and Director of the Wireless Innovation Laboratory (WI Lab) Each chapter is written by internationally renowned experts, giving complete and balanced treatment of the fundamentals of both cognitive radio communications and cognitive networks, together with implementation details Extensive treatment of the latest standards and spectrum policy developments enables the development of compliant cognitive systems Strong practical orientation – through case studies and descriptions of cognitive radio platforms and testbeds – shows how "real world" cognitive radio systems and network architectures have been built

This book constitutes the proceedings of the 16th International Conference on Detection of Intrusions and Malware, and Vulnerability Assessment, DIMVA 2019, held in Gothenburg, Sweden, in June 2019. The 23 full papers presented in this volume were carefully reviewed and selected from 80 submissions. The contributions were organized in topical sections named: wild wild web; cyber-physical systems; malware; software security and binary analysis; network security; and attack mitigation.
