LabVIEW(R), a product of National Instruments Corporation, is an interactive, hands-on, object-oriented software environment used in instrument control, communications, and a wide range of other applications. It uses graphical language in creating a virtual instrument (VI), which can acquire and process data, display results on a graph, control another instrument and/or an external system, and perform simulation and many other tasks. Because a VI is a software file, it can be easily reconfigured to meet the requirements of a new specification; this ability to alter the functionality of an instrument is an advantage that was never before available to the user. "Applications in LabVIEW" is a comprehensive text that includes -a wide range of data acquisition, analysis, and simulation experiments using LabVIEW software. Topics are presented ranging from an introduction to the basic tools and features of LabVIEW to in-depth, practical experiments with the software. Users are required in many of the experiments to modify existing software in order to achieve a specific measurement, a procedure that will help them better understand the use of LabVIEW. Virtual Instrumentation is the use of customizable software and modular measurement hardware to create user-defined measurement systems, called virtual instruments. The concept of a synthetic instrument is a subset of the virtual instrument concept. A synthetic instrument is a kind of virtual instrument that is purely software defined. A synthetic instrument performs a specific synthesis, analysis, or measurement function on completely generic, measurement agnostic hardware. Virtual instruments can still have measurement specific hardware, and tend to emphasize modular hardware approaches that facilitate this specificity. Hardware supporting synthetic instruments is by definition not specific to the measurement, nor is it necessarily (or usually) modular. Leveraging commercially available technologies, such as the PC and the analog to digital converter, virtual instrumentation has grown significantly since its inception in the late 1970s. Additionally, software packages like National Instruments' Lab VIEW and other graphical programming languages helped grow adoption by making it easier for non-programmers to develop systems.

The goal of this book is to help students learn to use LabVIEW on their own. Very art-intensive with over 400 figures in all. There are numerous screen captures in each section taken from a typical LabVIEW session. The figures contain additional labels and pointers added to the LabVIEW screen captures to help students understand what they are seeing on their computer screens as they follow along in the book. A directory of virtual instruments has been developed by the author exclusively for use by students using Learning with LabVIEW and is available on www.pearsonhighered.com/bishop. These virtual instruments complement the material in the book. In most situations, the students are asked to develop the virtual instrument themselves following instructions given in the book, and then compare their solutions with the solutions provided by the author to obtain immediate feedback. In other cases, students are asked to run a specified virtual instrument as a way to demonstrate an important LabVIEW concept.
